A SALUTE TO THE NAVY

A record-making over water non-stop formation flight of 2,408 miles from San Francisco to Honolulu now stands to the credit of the Officers and Crew of Squadron VP 10. For this unprecedented and thrilling accomplishment of which all America is justly proud, we respectfully tender this richly deserved salute.

SKF PERFORMANCE INSURES

▼ ▼ ▼ SAFETY ALOFT

SOARING through the sky at more than a hundred miles an hour in a Curtiss-Wright ship, the world for the pilot and his passengers depends upon the continuous performance of a propeller and its related parts . . . the smooth operation of bearings on the propeller shaft that makes for maximum safety.

When Curtiss decided to make a better propeller they instinctively turned to SKF Bearings because they know . . . through past performance . . . that SKF's have the stamina . . . the dependability . . . to do their work thoroughly above the clouds as well as on the ground. The result is the above controllable three-blade pitch propeller . . . equipped with SKF's. There's no need for further description . . . the picture speaks for itself . . . for there's no adjustment and no lubricant leakage . . . but plenty of STANDUP ABILITY in SKF Bearings.

► For many long hours in a Curtiss-Wright ship you can depend on SKF bearings to keep the engine running smoothly and safely.

Another TRIUMPH for the NAVY and WRIGHT CYCLONES

The U. S. Navy flight from San Francisco to Pearl Harbor, Honolulu, Hawaii—a distance of 2408 statute miles—set a new world's record by accomplishing the longest non-stop searoute west flight in the history of Aviation.

The best previous record was set by the same squadron last September on the non-stop flight from Norfolk, Virginia, to Coco Solo, Canal Zone—a distance of 2079 statute miles. After routine maneuvers at Coco Solo, the squadron flew to San Diego, California, a distance of 3293 miles, making but one stop en route.

Normal tactical operations were then carried out by the Navy for several months before the squadron proceeded to San Francisco for the record-breaking, Pacific Ocean flight. The Honolulu flight covered by 544 miles the record established in 1931 by General Luke Bell and his squadron on their flight from Italy to Beirut.

Lieutenant Commander Knutler McGivern commanded the squadron, which consisted of six long-range Consolidated Flying Boats, each powered by two Wright Cyclone Engines. The "Cyclones" functioned perfectly throughout the 2408 hours of grueling flight.

The Honolulu flight was in no sense a stunt. The squadron accomplished an extraordinary thing in a routine way. Service planes were used without alterations or additions. The flight officers gave credit to the Navy, and indicate the high state of efficiency of both personnel and equipment.

Wright Cyclones Are Standard Power Equipment of the Flying Boats in all of the Patrol Squadrons of the United States Navy

B★A★30

BALLOON AND AEROPLANE

A grade A fabric developed specifically to secure certain features of superiority which are proven by actual comparative tests!

When we designed B★A★30 more than a year ago it was our purpose to build the lightest Grade A fabric yet made and still retain sufficient uniform strength to preserve an adequate margin of safety over the government specification minimum of 80 lbs. This would increase the pay load by decreasing fabric and dope weight and decrease doping costs.

Inasmuch as a chain is no stronger than its weakest link, we concentrated on building a fabric whose minimum strength in any one place exceeded the average minimum required by the specifications.

We set out with these aims over a year ago. We have sold B★A★30, a new fabric, to the aviation industry, not through any price cutting or bargain day activities but through sound engineering and merchandising of a superior product. To determine its superiority over other Grade A cloths we secured impartial comparative tests through the Textile Laboratory of

Massachusetts Institute of Technology upon open market samples of B★A★30 and two other leading makes of cloth. These tests showed as follows:

- (1) Minimum fabric failure for B★A★30 was at 81 lbs.
Make X was at 77 lbs.
Make Y was at 73.5 lbs.
- (2) Strength variation between maximums and minimums for B★A★30 was 10.5%
Make X was 13%
Make Y was 19%
- (3) Weight for B★A★30 was 3.79 oz./sq.yd.
Make X was 3.87 oz./sq.yd.
Make Y was 4.15 oz./sq.yd.

In the face of the foregoing figures, substantiated by other reports, we sincerely believe that we have produced in B★A★30 an aeroplane fabric which is more uniform and stronger both per unit of weight and with respect to minimum strength than the leading Grade A fabrics on the market.

THE TWA SCHEDULE flight of the Douglas Transport from Los Angeles to New York is just one of the many ways in which the new era in transportation is being ushered in. With each succeeding test of this new Transport it has proved itself the

ultimate conclusion of everything that a transport should be—in outstanding in passenger comfort and satisfaction in its performance. It is, by right, the latest service master of the airways. Douglas Aircraft Company, Inc., Santa Monica, California, U.S.A.

DOUGLAS TRANSPORT

Let's Satisfy Our Curiosity

Let's take a close-up look at this new Martin Bomber

WHY has the new Martin Bomber created such a sensation? Why do military authorities call it "the most formidable weapon yet developed for aerial offense and defense?" Why did it receive the 1935 award of the Collier Trophy, for "the greatest achievement in aviation in America during the preceding year?" Why can it carry terrific loads with a speed and ease never seen before?

Look for the answer in the construction of the plane itself. You'll find a plane built of a new aluminum alloy—25% stronger than any ever used before. A new type of wing construction that supports 142 pounds per square foot, with a lift-profile drag ratio of 135. A new type "restrained shell" monocoque fuselage—lighter and stiffer than any that we know of. A new

type tail structure—stronger without external bracing than former tails with it. A new engine-propeller-wing combination with a propulsive efficiency of 85%—a degree of efficiency hitherto reserved for Schneider Cup racers.

These are some of the important new developments which are embodied in the new Martin Bomber—developments which have been made possible only through the closest cooperation between the Officers and Engineers of the Army Air Corps, the N. A. C. A. and the Martin organization.

These same developments, applied to commercial planes, will make air transportation far more rapid, more efficient and more profitable than the best that we know today.

BUILDERS OF DEFENDABLE

AIRCRAFT SINCE 1903

A Record of Solid Accomplishment

THE FIFTY of AVIATION's annual statistical review number laid upon a sea of trouble. The Army is flying the mail, gallantly doing its best with a problem of appalling complexity. The airlines have lost two-thirds of their revenue during the past week, and have no way of knowing when or whether they will get it back. The power industries in that order, something happens very soon the amount of passenger service provided will have been reduced about a third by the time this issue of AVIATION actually reaches the reader. The maintenance of airports, but we retained the domestic air mail operation, is understood to be preparing to move on to see what can be done about the foreign mail service.

In the meantime the great powers of the world are busily modernizing and expanding their air forces, and we are moving along in that direction ourselves. In particular the Navy is at last accepting an endorsement to increase the total number of naval airplanes to provide equipment for the ships that have been added to the fleet since the last authorization was framed, so contemplating the Ranger from her threatened ancestry role of being an airplane carrier without airplanes. The Army's program is indefinite, but certainly an endorsement of some kind is in the making.

How rapidly it will be made remains to be seen. With our committee and a grand jury investigating government work, with all placing of contracts held up, and with a welter of schemes of graft, diversion, and contractors in government plants, and varied amendments in the basic procurement law and in procurement tactics, and with disorganization by professional disorganizers all competing with each other for attention, the immediate prospect is for more confusion than progress. Struggling to bring the kaleidoscope scene into focus, one is struck to remember, suddenly, upon the optimism with which the editor of AVIATION only two months ago undertook to prepare his annual prospect for the aeronautical developments of the year. Just as

present one could assemble enough seventh sons of seventh sons to make a complete football team, and the whole could wouldn't be able to figure out what was likely to happen next Thursday, to say nothing of the week before.

But as one can work extremely far, a month upon the record of what has happened in American aviation in the past two or three years without feeling at least a little optimistic. At least up to within the last six weeks, aviation had come through the depression without the loss of any essential ground. Aircraft and air travel were going in public confidence and appreciation, and public patronage of these services was gradually increasing. Technical progress has been enormous and at times, particularly during the last eighteen months, it has been spectacular. The number of pilots who keep their licenses active and the number of privately owned planes have come surprisingly close to holding their own through a period of unparalleled general disinvestment and hoarding. The value of aircraft in military affairs is being indicated with unprecedented enthusiasm, even in quarters hitherto among the most skeptical. Whatever else happens from now on, it is inevitable that there is to be a great and growing need for air transport and for military aviation, and also a substantial demand for private flying.

Nothing can destroy the logical record of the past, condensed here in 20 pages of pictures and charts and tables. They tell the history and give the present status of one of the greatest and most enterprising and most resourceful endeavors in the whole long life of engineering science and of industry. We know that our regular readers, who are already acquainted with most of the story, will re-read it carefully and with a satisfying glow. We sincerely and cordially commend it to the attention and the careful consideration of the people outside the ranks of aeronautics who always insist it can come and most especially of all to those who are charged with the responsibility for determining the policies of the government.

as the result of the restraint of the contract in other quarters. To adopt any such policy as that would be just exactly to look at it as for a city government to offer four-year franchises for street railway operation with no presumption right for the recipient of the franchise to continue running after the four-year period has expired, and with a consequent necessity of shortening the entire cost of laying the track and purchasing equipment over two brief runs of time.

A. BUYER & LARSEN

[illegible]

Before we turn to detailed examination of the various ways in which the beneficiaries of government aid should be selected, the question of the form that the aid should take deserves at least a passing glance.

Most of the countries of Europe and in fact practically all the countries in the world except the United States and Canada, have succeeded by giving direct subsidies to aviation. In the United States, the United States Government operates its airlines through a system of indirect subsidies known as mail subsidies. Either system is perfectly feasible if properly handled. Either one is capable of giving terrifically bad results if misapplied. Most of the European countries have had more or less extended periods of very unhappy experience with subsidies. The United States has had a very long and very unhappy experience with subsidies. The United States has a very little encouragement for the development of a genuine commercial traffic, and in fact in some instances they have positively discouraged it. Some of the very elaborate regulations concerning the licenses to be paid for various types of equipment have resulted in the development and adoption of transport aircraft of a type of characteristics extremely unsuited to profits or loss.

PROFITS AHEAD FOR THE GOVERNMENT

A subsidy law can be drawn which will be common to these drawbacks, and some of the European countries are working out in a reasonably satisfactory fashion. On the whole, however, the air-mail contract has seemed a most satisfactory

[illegible]

ROUND-WIRE PAYMENTS AGAIN

The suggestion is now being made that the payment to the contractor for handling the case should be put on a weekly basis. This would be a very desirable change, but the volume of mail traffic calculated on paid basis rather than simply to the number of cases flown by the company's mail-carrying aircraft would be a very serious disadvantage. The present type of compensation has been introduced in Congress, and the type of new award being introduced in Representative Keefe's bill. The bill of Representative Keefe is the bill of the House. Unfortunately some of the talk about the development of new normal operations has perhaps led to the policy to support the bill of the House. This is a very serious mistake. It is a doubtful proposition to the retention of the basis of payment and in putting the air-mail service upon a tender and more basis. The bill of the House is a very serious mistake. It is a doubtful proposition to the retention of the basis of payment and in putting the air-mail service upon a tender and more basis. The bill of the House is a very serious mistake. It is a doubtful proposition to the retention of the basis of payment and in putting the air-mail service upon a tender and more basis.

In this paper, conversion is the variety of total debt refinancing the so-called *contingent* and especially the impact of the *contingent* companies have been subject to much discussion in the literature. The main reason for this is that the conversion of debt into shares is a form of *financial engineering* that can be used to achieve a variety of financial goals. The main reason for this is that the conversion of debt into shares is a form of *financial engineering* that can be used to achieve a variety of financial goals. The main reason for this is that the conversion of debt into shares is a form of *financial engineering* that can be used to achieve a variety of financial goals.

If it be accepted as proven that there must be government assistance of some kind and that it must be extended on a long-term basis if a proper system is to be maintained, it remains only to be considered how that assistance should be allocated. It is obviously impossible to hold out the offer of government aid to all farmers. There must be some discrimination. Under any system of aid or under any method of awarding contracts that may be used there will be some people or some corporations that will not get the contracts and others that will take large amounts.

to have them but will fail of as award. Under any conceivable system involving any degree of private ownership, after the awards have been made and the benefit has died away it will be found that there are still "insiders" and "outsiders," with the latter able in some cases to operate (usually on a very restricted scale) without government assistance because of exceptionally favorable conditions or as a result of paying correspondingly low wages to personnel or of creating ambiguous accounts of themselves to be desirable.

OHG INC COMPANY

[illegible]

To return once more to the question of method of allocation, of course the first possibility that seems to emerge is the use of competitive bidding. We have already considered this in passing as though it were to be taken more or less for granted. It is as a matter of fact the system that has been used throughout, and apparently with very good results. The volume of operations is increasing, the average bid is decreasing, and the results that have been obtained in open competition. In the buying of the 28 domestic aircraft contracts (all types of variants have been outstanding there were two or three competitors for 28 of the orders, and most of the ten variants for which there are only a single bidder were short and relatively unimportant contracts). The average order of cost was very shortly cancelled and almost squandered.

Private enterprise holding companies must be held responsible to our shareholders, our constituents, and it is essential that continuity of management be maintained. It is not the business of the government that the fundamental object of government assistance be to build strong and self-reliant enterprise systems, and not merely a stage one. It must be realized that that goal is only fully attained when the enterprise is self-sufficient and capable of financing its own expansion needs controlled by people who have every evidence of their intention of staying in the business, of continuing a reasonably permanent source, and of using the fullest available resources to develop and expand the enterprise to the fullest possible development. It must be borne in mind that responsible holding for an enterprise is useful almost every other form of confidence building so that the Agency on the end member of the chain of confidence building is the private enterprise. The government of managing the sector. In this rapidly developing and it would be dramatically false for the government to be self-doubt for any considerable length of time to try to

the European countries have tried to get around this difficulty by letting subsidy contracts on the basis of a specified rate of deterioration in the subsidy payable, but that this tends to work out very well because of the virtual impossibility of forecasting the duration of live or sea years hence or the amount or type of assistance that may then be needed in so far, and so partly changing a field.

AVIATION INDUSTRY'S INCOME IN 1935 (Each symbol represents \$1,000,000.) Annual turnover for the entire aviation industry shows the importance of the income from mail carrying and from the sale of military airplanes and engines. Red symbols indicate money coming in from the outside while the black figures show that which is circulated within the confines of the industry.

danger. It seems open the attention of almost every business being as an instrument of commerce—as an instrument of exploitation—as an instrument of sport—once in the spirit of pure romance and once the most severely practical grounds.

But it is not romance alone, or military and commercial uses alone, that make aviation interesting to business men. It has the straightforward industrial significance of an industry that already presents a score of different faces, draws its supplies from a headless billion sources, and promises a growth that will not stop short of attaining the front ranks of industry in due course.

Speculation upon the future must play small part in a statistical report. Upon these pages, and many pages that follow, we have an endeavor to make a record of the progress of American aviation. We fix our attention not upon what it is to become but upon what it is today. And although the aviation industry is not among the folkless members of the industrial family as nature, even upon one plane there is no occasion to apologize for it. In round numbers, American aviation represents a commercial activity of \$19,000,000 a year.

If the money bags illustrated on this page, the hundred millions have been depressingly traced. They have been subdivided by divisions of the industry and by the nature of the activities upon which they are set, and subdivided again in terms of the source from which the money comes. In rating the volume of business done by any industry or group of industries, it is necessary to make a very careful discrimination between the money that comes in from the outside, and that really goes in the industry its livelihood, and that which is simply passed around within the ranks. The aviation industry, perhaps more than any other, needs to take to heart the lesson of what happened to the power where all the calculations began by taking in each other's washings. During the latter stages of the last departed house a large part of the industry was

engaged in selling to itself, and that is a process that soon becomes unworkable. If the air transport lines were the only purchasers of aircraft, and if nobody but the employees of the airplane companies rode on the airplanes, it would be only a question as to when time would lock the airplane and the factories were used to through education of their capital. The airline must have a large proportion of customers who made their money out of something totally unconnected with aviation, or the factory must find purchasers for a good part of its product outside the aeronautical circle, or both. The real index to the size of any industry is found in the amount of money that comes into it from the outside.

It is far that reason that we have discriminated with such care. In drawing up our diagram, we have built an imaginary wall around American aeronautical activity as a whole. As a mechanical condition of our survival there must be a steady flow of dollars inward and of goods and services outward across that wall, and we have counted the dollars that cross it and given them the place of honor in our picture. From the point of view of an oil company, there is nothing to choose between the sale of gasoline to the owner of a private airplane and the same sale to the owner of a flying school—assuming that their checks are equally good. From the point of view of the oil industry as a whole, however, there is a marked difference. The order from the private owner is primary, and the bill is paid with money directly derived from outside of aviation. The order from the flying school is secondary, and in order that the bill may be paid at all another sale (the sale of flight instruction to a student) must be arranged.

With all the lengthy explanations cleared away, we can look at the chart and in red and black money-bags and consider their meaning. We can consider, too, the ultimate destination of this \$77,800,000 that comes into the industry from the outside world. Roughly speaking (though as accurately as can be determined from the accompanying figures), \$59,000,000 goes directly to labor employed by air transport lines, aircraft manufacturers, and operators of airports and of flying schools and the like. Another \$28,000,000 is lost out for supplies and materials, including such necessary products as fuel and oil. About \$10,800,000

goes into the salaries of a widely distributed technical and administrative staff within the aviation industries. Approximately \$4,500,000 represents the net profit of the industry as a whole. The remainder covers taxes, interest on loans, rent, and a variety of other items. The expenditures for supplies and materials were actually to be traced to their ultimate destination at the point where the air that was commonly to be part of an airplane engine came out of the ground, it would be found that about 90 per cent of America's total income goes to the sale of one piece of another, that nearly a third of the remainder is paid out to skilled personnel receiving salaries of \$7,000 a year or less, and that taxes consume a substantial proportion of the residual 25 to 30 per cent.

It is hardly necessary to explain items of the diagram in detail, for they speak for themselves. If a comparison were to be made between this chart and a similar one drawn for two or three years ago, it would be apparent at every turn with what remarkable accuracy air transport has indicated general economic catastrophe—a picture of which more evidence is given on the immediately succeeding pages. History is dependent upon private and industrial aviation, on the other hand, the operation of airports and of flying schools being poor cases in point, has fallen off badly. Fortunately there is now every reason to think that the bill has reached its lowest point and that the turn has arrived, and that those that now sit a very small figure on the diagram of aeronautical income will reach their stride and begin to provide their million-dollar symbols across the page for the diagrams of a year or two hence.

Of the factors that control these various divisions of aviation and of recent experience in connection with each of them, there is much to say in the twenty pages that follow. Giving precedence to those sections of the industry that predominate in volume, we turn at once to air transport, which has played most notably through a series of years in which an economic tide went has stopped all other forms of transportation (and in that track, as shown there, back with static traffic figures of actually receding seas. How difficult a story is to be told for aviation our index numbers of passenger travel by air, rail and highway make plain.

Aviation, A Diversified Industry

A hundred million dollars of annual turnover

GIRTH around the globe is not the measure of the greatness of a man, and volume of output does not determine the superiority of an industry. An American industry gets its backing and operating of aircraft is not among the largest. It falls far short of the billion-dollar class. It employs only a small fraction of a per cent of the country's working population. Yet it is an industry in which enterprise is mirrored. It is an industry of which almost everyone feels that he knows a little, and desires to know more. There is something appealing about this aviation business; there is something that arouses an insatiable curiosity.

Aviation has the appeal that always belongs to the newest and to the richest form of transportation, and especially to a form unshackled by fixed pathways—man's latest contribution to the utilization of his own wonderland.

It appeals as the living evidence and the growing embodiment of triumph over the law and the most difficult of the natural elements to be invaded and tamed. It holds our interest as the very keystone of national safety, now that air power has become an essential factor against natural

AVIATION
March, 1935

AVIATION
March, 1934

AIR MAIL POUNDAGE. The actual postage figure of 7,948,000, as indicated by the dark portion of the 1933 and 1934 bars, was more, by the same, for both years. A further reduction of the postage, stated mail in 1933, however, resulted in a slight drop in the approximate postage figure that would have been recorded under the old system of accounting, as indicated by total lengths of bars including the stated portion. The slight decline is more than fully explained by the increased postal rates which took effect in July 1932. It was then that the previously over-estimated airmail total reached the correct point.

TRANSPORT MILEAGE. The percentage increase in airplane flows in 1933 over that of 1932 was less than that of passenger mileage, proving a marked increase in traffic density and public patronage. The figure for 1933 was 36,642,943 miles as compared with 32,532,363 miles in 1932, an increase of 13 per cent. Additional transport planes have been flying a distance equal to circling the globe once every four hours, day and night throughout the year.

PASSENGER MILEAGE AND EXPRESS. American airlines flew 158,090,079 passenger miles in 1933, an increase of about one-third over the figure for 1932 and nearly 2 per cent of the long-haul railroad traffic for the year. An express has gained substantially losing weight a total of 2,452,512 lb. for 1933, an increase in postage of 54 per cent over the 1932 record.

Transport Goes Steadily Forward

Dependence on the air mail appropriations rapidly reduced

THE POWER of air transport in 1933 can be competently summarized in two words—everything up. Most often, faster, more passengers carried, more miles per passenger for the average traveler, more express, more safety, more speed, more comfort—more everything except air mail and expense to the government. The air mail postage dropped all by a few per cent from the figure of the previous year, owing to the expiration of the new and increased postal rates which were effective all through 1932 and had influenced the figures only in the latter half of 1932. As for government outlay, that was cut very drastically by decision of the Congress and the President.

As in 1932, the most striking progress was in passenger traffic. It has practically doubled in the past three years, and on the whole it has shown a steadily increasing rate of gain. The total passenger miles of traffic on airlines under the American flag were increased by 16 per cent in 1933 over 1932. The next year was 22 per cent ahead of 1931. In 1933 there was a new increase to 35 per cent above the 1932 rate. Not for four years had there been in large a relative advance over the previous year.

To put the gain in other terms, in 1933 the American airlines handled traffic of about one-third of one per cent of the long-haul traffic (trips of over 100 miles) of the American railroads. For 1933 the proportion was up to almost 2 per cent, and if we were to depart from the broad statistical outlook to make individual surveys we

would find many hundreds of business men, constantly traveling, who make 50 per cent or more of their trips by air.

Higher commercial efficiency.

The increase in total mileage flown was much less striking than that in passenger traffic—only about 7 per cent over 1932. The number of passengers per plane increased to about 34. Lumping all services together, the average American transport plane has approximately 100 passengers per year. The "commercial" efficiency for the year was 36 per cent for the American air transport system as a whole, but for the main trunk lines operating between principal centers of population it was much higher than that, and for restricted periods during the season of peak loads loadings had to be made several days ahead to have a certain safe chance of securing a seat.

Air mail fell off slightly, the explanation being, as already noted, in decreased rates. The outstanding feature of the year so far as air mail is concerned, however, was not the variation in passenger but the rapid approach of air transport toward complete self-support and independence of any sort of a subsidy or of any financial assistance from the government, direct or indirect. For the four months from July to October, inclusive, the total payments to all contractors for handling the air mail were but 27 million per month as against an income in the Post Office Department from air mail postage constantly estimated at one million per month. The United Air Lines system was showing less

During depression, competition of highly developed motor transportation, rapidly decreasing governmental support, and increasing development expense, American air transport has forged forward and speeded to a successful and unexcelled growth. The order in the upper right hand corner of this page serves to summarize the progress, including within each major feature in passenger, express and mail traffic, efficiency of operation, and mileage flown.

The text for this section and for all those which follow next in progression at the close of the air mail contribution order and it has not been reached. We have examined the contribution order and its effects elsewhere, but our statistical analysis refers to the normally functioning transport system of June 31, 1933.

the Post Office but 168 million per pound-mile, the entire Transcontinental & Western Air system lost 201, the Chicago-New York route alone only 115. On the various suggestions regarding postal revenue, United Air Lines and TWA were handling the mail ever all their routes at very near to an actual profit to the government.

Heavily-loaded routes

In a system of airways that leaves the United States from Chicago to San Diego and from Miami to Seattle, with three separate spurs into Canada and with extension into more than a score of foreign countries, the traffic is far from uniformly distributed.

Upon the map of traffic showing the influence of the Chicago expansion and of the tremendous travel to and from Washington during the summer in connection with the efforts of NRA and AAA are quite apparent. As far several years past, the New York-Washington route has shown the heaviest load, holding an average of over 180 passengers a day. Though there are no statistics permitting of a positive direct comparison, it is probable that the air travel between New York and Washington during the past year was more than 15 per cent of the number of passengers occupying seats in Pullman cars for the same trips. The New York-Chicago line came next in density, with 99 passengers per day

The total of all the alternative routes between Los Angeles and San Francisco shows 60, and the route to the westward out of Chicago to the Pacific Coast carried an average of 39 passengers per day over the full season.

American transport overtaxed

Statistics for foreign travel in American airways are not broken down to permit so elaborate an analysis, but about 40,000 travelers left the United States or re-entered it by air during 1931, along with some 150,000 in total and 400,000 in all capacity. The effect of this foreign service upon the prosperity of American industry cannot be easily defined, but government departments such organizations as the Foreign Trade Council, and individual exporters have noted in declining it.

Another element not strictly susceptible to statistical treatment, yet one of which some instance should be made in connection with the statistics of traffic and of extent of service and of one to the government and the like, is speed. Each week's schedule sets the typical cruising speed on American airways now 120 m.p.h., and only on a very few instances was that exceeded. At the beginning of 1934 approximately half of the daily schedule mileage was being done with machines cruising at 150 m.p.h. or better, and orders already placed assure that by the

end of this year or the very early part of 1935 substantially more than half of the total mileage will be flown at over 150 m.p.h. By the end of this year of the present air transport system is fully motorized and allowed to develop normally, it will be possible for a traveler of any city in the United States to reach any other such city in the United States within 24 hours.

New equipment coming

To raise the speed of air transport noticeably by decreasing the maximum speed of every machine on the transport lines and averaging them all would be comparatively simple, but it would be very unprofitable at a time when a general replacement of equipment is in process and when a considerable number of planes, obsolete because of their limited performance and high operating cost (though still capable of giving perfectly safe and reliable service), are still carried on the books and to some extent used. The equipment situation on the air lines is shown in two charts on page 73. Incidentally, their expense was of the reason why the present period is particularly critical for air transport and why it is particularly important that any abrupt change in the transport laws from preventing with encouragement for the purchase of new airplanes should be avoided. A

tremendous number in transport planes were bought in 1932, and 66 per cent of the number then acquired are still available for service, the rest having been scrapped or sold for sale-transport use. As a more and more intensive and efficient use of equipment has made it possible for the lines to do a steadily increasing amount of flying without increasing the number of planes in service, the total bought in 1932 have continued to carry the major part of the burden through the succeeding three years with only a very small number of replacements in addition. The normal life of a transport plane, with progress continuing in the rate which ought to be considered as normal in the early days of a new industry, should be about four years. Machines may still be in perfectly sound condition in the end of a four-year period, but they are likely to be obsolescent, and their operation accordingly relatively uneconomical. On this basis there ought to be a turnover of about 25 per cent per year in equipment, yet on the line of the last four years less as much as 30 per cent of the existing equipment has been replaced. The result is that almost a half of all the airplanes owned by the transport lines are now more than four years old and ripe for immediate replacement. At least 225 new machines ought to go into service within the next two years, and if the government will continue to extend a modest and a gradually diminishing financial support for air transport it is safe to predict that in 1934 that number will actually be bought and put into use. Cudahy for approximately 150 planes

AIR MAIL DENSITY FOR 1932: As in previous years, the thorough transcontinental routes show the heaviest patronage.

AGE OF TRANSPORT PLANES (above)
Nearly one half of the transport planes in service are more than five years old and therefore only for replacement at the end of 1935. Although airplanes are quite capable of giving safe and reliable service beyond the five-year period, they are inefficient and uneconomical to operate at compared with the more recent products of research and development.

TRANSPORT DISTRIBUTION (above and data on next page)
The equipment program of the major American transport operators and their effects on production are shown impressively in this chart. Transports of similar vintage, however, are giving satisfactory service. Open planes have gone into total obsolescence since 1931.

DAILY SCHEDULES Maximum frequency during 1933 of passenger transport services in operation at the end of the year. Seven transcontinental round trips were made daily.

PASSENGER TRAFFIC DENSITY. The width of line for each route indicates the average number of passengers carried each day during 1933.

for the earliest possible delivery are already on the books at the manufacturers.

Planes more intensively used

Passing remark has already been made on the success that the transport companies have had in getting more and more service out of a constant or even a gradually diminishing amount of equipment. The total number of airplanes owned by American air transport companies today is about 13 per cent less than the number three years ago, yet the volume of operations has increased by more than a half within that period. That of course is one of the master keys to economy, and so to independence of governmental assistance. During 1933 for the first time, the average distance flown for every plane owned by a transport rose to exceed 300,000 miles. For service of the larger companies the average was over 190,000 miles per airplane. The

American performance, whether compared with aviation elsewhere or with other types of transport at home, is undoubtedly a class by itself.

Intensity of operation is still reinforced by inclination on the part of such a large amount of store or less obsolescent equipment, and if the modernization and turnover of equipment is completed within the next two years, as it normally should be, the usual national average by the end of that time should be well over 300,000 miles per airplane and may even exceed 300,000. Individual planes of strictly modern types have already been operating over protected routes, in some instances, at a rate of more than 300,000 miles per month.

Government support essential

In the light of seven years' experience, it is hardly possible to complain too strongly the importance of the government's air mail policy to air

transport. It must be frankly recognized that a proper air transport system, manned by well-qualified personnel and with a proper ground organization to insure the safety and the reliability of the service under all sorts of conditions, cannot for the time being be made truly self-supporting on passenger traffic alone. Every country in the world has learned that lesson, and every one of the major states and most of the minor ones have given air transport some sort of direct assistance. In this country the assistance has come through air mail contracts, and with the growing popularity of the service and with steady improvement in the inherent economy of air equipment and the efficiency of its methods as dependence on government help has steadily declined. Some measure of that dependence, however, still remains, though certain lines have now reached the point of receiving from the government no payment for the carrying of mail no more than the Post Office Department itself receives from air mail postage. The present indication is that within another three years at least the nation's whole air transport system will have reached that happy state, provided of course that the situation it is not bedeviled with further crises brought on by immigration traffic and started in response to political pressure. Within a few years after that the position of the airlines should be strong enough so that they can get along as passenger and express business alone, perfectly indifferent as to whether or not they carry the mail on any terms. For the present, however, it is well to recognize that no such confidence has been attained. If direct evidence of that

SEASONAL TRAFFIC TRENDS. A comparison of three years of transport operations shows a general similarity in the curves. Air travel is still much more popular in warm weather than in cold. The very marked rise to the 1933 peak can be attributed largely to the Century of Progress Exposition in Chicago.

is sought, it will be found in the records of attempts to operate airlines without mail contracts.

Subsidies?

To appreciate the real financial situation of American air transport, the picture of a row of coins on page 27, which shows the average rate of payment by the government to air mail operators, has to be read in conjunction with the chart of air mail income to the government elsewhere reproduced. A very loose and academically misleading practice of speaking of the entire air mail appropriation as a "subsidy" has become common within the past couple of years. Nothing could be more ridiculous. The air mail appropriation is a whole in no sense a subsidy than the appropriation for transporting mail by railroads as a whole is a subsidy to the railroads. Whether or not any part of the air mail appropriation is properly to be considered as a subsidy to air transport under present conditions is an open question, since the line as to which the government loses the largest volume of money are those in which the air transport industry as a whole has the least interest and which in many cases have fairly been forced upon the operators in response to the demands of certain groups of consumers for

DAILY TRANSPORT REVENUE. As a result of additions to transport systems in 1933, the daily scheduled mileage has increased to 150,000—4.2 per cent above that of 1932. This proportion flows with mail revenues high, 40 per cent of the total.

the benefit of air mail. The subsidy in these cases seems to be to the consumer concerned, not to the transport companies. As has already been noted on a couple of occasions (but if cannot be too often repeated) the main trunk lines are now handling the mail substantially without net cost to the

AIR TRANSPORT BY CARGO. Before the passage of the new law on February 28, 1933, a relatively small proportion of transport planes carried high passengers and mail. As the end of 1932, 71 per cent of the passenger and mail routes carried passengers and mail in the same equipment while seven carrying passengers or mail alone have decreased relatively, to a very marked degree.

government, according to the commonly accepted basis of appraisal of air mail income, but not only in the term "subsidy" is obviously and grotesquely out of place.

If we are to talk of subsidies at all, it must be with the net cost of air mail, or the excess of the expenditure on the whole system over the governmental income from the whole system, that we are concerned. The gross cost to the government, paying no attention at all to income, has not only been steadily reduced, but reduced at a constantly increasing rate. In 1929 the air mail operators were being paid an average of over \$1 a mile for carrying mail in single-engined open-cockpit planes which might have a passenger accommodation at all or might provide for one or two passengers in a somewhat cramped position if it happened

that there was room left for three others the mail had been landed. At the end of 1933 the mail was being flown 40 per cent faster and with a substantially improved regularity and reliability, using multi-engined planes for long-distance passenger service, and just watched the gross cost to the government that provided last year earlier.

At the same time the net expense to the government, or difference between outlay and income has been cut down from a little over 75 cents per mile flown on the domestic routes in 1929 to 20 cents for the year 1932, and to 19 cents at the end of 1933.

New safety records

The safety of air transport must not simply be abandoned without question of regularity and safety is written. Upon both headings continued research, the moment skill gained through increased experience with personnel, and the maintenance of constant equipment are showing their effects. Following a number of years in which the percentage of scheduled air mail flights flown without accident 92.5, the percentage of performance has increased in 1932 to 93.7 and in 1933 to 94.4. In the course of two or three years the amount of mileage can be carried on out of weather has been reduced by a fourth. Windy flying studies are bearing fruit.

In regard of safety, the relative improvement is far more spectacular. In 1929 the safety records of American air transport were already being established with the best that were being made by the most carefully and efficiently and conservatively operated lines in Europe. In 1932 the number of passenger-miles flown per passenger fatality was more than twice as high as in 1929, and in 1933 it was substantially more than double the 1932 level—practically a twofold improvement made in four years. On the basis of the 1933 statistics, an airplane passenger could make a round trip across the continent every month for fifteen years and only have one chance in twenty of meeting with serious accident.

At the same time the pilot safety record has been substantially improved. Pilot safety always lags a little behind that of the passenger, as the protection of the traveler is necessarily paramount, and in particularly bad weather the pilot is left on his own with the mail and a parachute while the passengers are left on the ground. Nevertheless the fatality rate among pilots was brought down, in 1933 to the extraordinarily low level of one for every 3,000,000 miles, or roughly one fatality for every 40 years of full-time flying.

In so brief a review of the record of progress of air transport it has been possible to list, either by short for by illustration or by actual documents, only a few particularly high spots. Having done this to hard as we could, we have nevertheless had to neglect many others almost if not quite as striking and as important. Some indication has been given through the selection and discussion of a few typical sets of data, of the magnitude and the efficiency of our air transport system, of

the regularity and soundness of its growth, and of the reason for its enormous background. It is a system that gives employment to some 6,000 men and women, including approximately 600 of the best and most highly trained pilots in the world, approximately 1,600 specially qualified mechanical personnel, and large numbers of specialists in radio, meteorology, and a variety of other applied sciences. Employing 6,000 people, it serves the interests at \$175,000,000

PAYMENT TO DOMESTIC AIR MAIL CONTRACTORS. In the face of ever decreasing compensation per mile, the operators have increased their scheduled mail speed and provided larger and more comfortable flying equipment. From \$2.87 in 1929, the payment per mile has decreased to \$2.35 in the last half of 1933. The average for 1933 was \$2.44.

POST OFFICE REVENUE. The air mail appropriation is not a subsidy. A substantial portion of it is derived from the Post Office in revenue from postage. In spite of a general decrease in air mail revenue, the Post Office Department's estimate of income received from domestic air mail for the third year of 1933 (\$4,116,441) was higher than that of 1932. National mail income dropped slightly, but remains nearly three times as great as it was in 1930.

THE GOVERNMENT'S DOLLAR. Transport operators have insisted their recovery to the Post Office Department in the face of decreasing compensation. Income numbers for service rendered per dollar paid by the Government are still available for 1933 as income of operators for the third year of 1933, at approximately 40 per cent over 1932. The Government has always received much more return for its governmental dollar than most foreign governments had come before to make in 1933.

AVIATION SAFETY. The average payments based on American airline increased in 1933 to approximately the average for the period from 1927-1929. There has been nothing in the whole history of air transport, at home or abroad, to parallel the American figure for 1933. Pilot safety in transport operations increased proportionately. Although fundamentally more hazardous the flying of the Army and Navy has also shown steady improvement in safety.

PLANS IN SERVICE (left). The number of aircraft in service in the United States at the end of 1933 has fallen off slightly, 6,876 planes were licensed, 2,813 destroyed at the end of 1933.

LICENSED PILOTS (below). The number of pilots holding licenses shows the effect of increased severity of the midtwenties requirements. The total at the end of 1933 was 12,840, of which 7,101 were transport pilots.

VALUE OF PLANE AND ENGINE PRODUCTION. Above: The value of American commercial and military aircraft production (including engines). Commercial production reached a monthly peak in 1932 and began a pronounced upward trend. Rising to \$8,150,500. Military business in 1933 was approximately the same as it was in 1932. The figure for 1933 was \$9,154,642. Above, left: The value of commercial and military engine production. Commercial engine business also showed upward but military production reached a new low of \$4,855,153, 22 per cent below that of 1932.

Airplanes and Pilots

Concentration on development is anticipation of better markets

THROUGH THE PROSPECTIVE, however, as commercial airplanes in 1933 were nothing over which to start dithering in the sheets, they have at least one remarkable characteristic. For the first time since 1927 they show an increase over the preceding year. A good many agencies that the worst was ever have been realized in the last few years, in the pages of *Airtransport* and elsewhere, but this is the first occasion on which the record of a full year's experience has provided evidence to readership optimism.

There will be plenty to say about the nature of the commercial production and about the reasons for the increase over 1932, but it would be a sadly mistaken distribution of emphasis that would dwell on these matters without first reaching on the state of the military market. In only two of the last seven years has the production of military airplanes surpassed that of one-half the total dollar value of airplane production in American factories. The proportion of engine production that goes to military use is almost as large. In 1932 65.2 per cent of the total output of airplanes, again measured in dollar value and not in terms of number of units, went into Army and Navy service. Of the remaining 34 per cent, roughly 10 per cent was taken by transport companies, 10 per cent represented export to foreign governments, and the remaining 14 satisfied the general requirements of the private and industrial market. Private ownership should have a very substantial, perhaps a tremendous, future. The industry wishes the development of private ownership with the least interest and with the least hope, but taking the industry as a whole, military sales are still the

backbone of its prosperity. Of course, however, any such distribution is a little misleading, even some companies make an admirable living out of private business, with no thought at all of military markets, while others are virtually 100 per cent military or military with a slight admixture of transport, and have never been in the private market and have no intention of getting there for some time to come.

Military business

The fiscal measures that attended the coming of the new administration just a year ago, and particularly the sharp reductions imposed on obligations to be incurred under the 1933 appropriation, resulted in the total purchase of military equipment falling to a lower level than in any year since 1927. That might seem to offer little reason for confidence that the month is over, but as the case of military orders the year has already come with the advance of Public Works funds for airplane equipment to the Army and Navy. During the course of 1933 production seemed to be falling to too low a level to admit of speaking. Industry cheerfully said of keeping its proper organization for development work on new types, but the industry at present is not merely of a return to the coefficient of 1932 but for an amount of military production exceeding anything since the War. Naturally this line of affairs has not grown out of any desire to promote the welfare of the airplane industry. The apparent decline to make a substantial expense in America's air forces, with the automatically consequent decline to buy great numbers of military airplanes, seems simply

For the first time in several years there is anticipation to be found in the field of aircraft manufacturing. Although military production dropped to a new low in 1933, the expansion of transport planes by all major operators had progressed sufficiently to ease the field and the army was headed upward at the end of the year. Production of civil and military aircraft, in number of units and in value, including airplane manufacturing for export, has been before now considered with varying weights in the preparation of the above notes.

from what appear to be the irreconcilable necessities of the world's political situation.

Military operations and the use made of newly-acquired military airplanes, have been discussed elsewhere in this issue. Having made a fully respectful salute to the importance of the military factor in the overall effort, we can now turn our attention back to the consensual side.

Please log in

The number of aircraft approved by the Department of Commerce for active service fell off substantially during 1951: the number of replacements fell

COMMERCIAL ENGINE PRODUCTION AND SALES

[illegible]

COMMERCIAL AIRCRAFT PRODUCTION AND DELIVERY

[illegible]

DISTRIBUTION OF AIRPLANE PRODUCTION BY TYPES. The ascendancy of closed airplanes in the past few years is shown by the melting and potting of the credit in the chart. In 1930 only 38 per cent of the planes produced were closed but the proportion reached 69 per cent of the total in 1932. On these the majority were from 4 to 7-gal., but the proportion of transport planes with eight or more places is constantly increasing and has now reached 16 per cent of the total. In the open plane segment the light planes were well on the way to preeminence in 1932, but showed some tendency to fall off during 1933.

OPEN OR CLOSED FLAME? Automobile experience is revealed in the struggle for supremacy of open and closed flames.

MONOPLANE OR BIPLANE? No one doubts that a biplane can be constructed in the monospace-biplane configuration, but if monospace is gaining slowly, both for transport and private-ownership types. The sudden swing to monospace in 1951, with a subsequent reaction, was due to the short-lived light-airplane boom of that year.

ing to make up for the slackening. At the end of the year the total stood at 9,384, almost exactly three-quarters being loaned and the remainder stocked—a lower total than at any other time since the summer of 1929, but only about 13 per cent below the peak figure of the early part of 1932. It is reasonable to say that there were

loss over the next four years should be at least 1,000 per year, regardless of any extension of the moratorium beyond its present boundaries. And whatever shortage develops in the early part of that period will presumably have to be made up in the later part.

Cotton plants with fewer

In 1935 the production, again excluding transport types and excluding also machines built by amateurs for their own use, was only about 600. The number was explosively small, but the distribution of production shed some interesting light on the changing nature of the private market and on the development of design thought.

Most striking of tendencies is the conquest of the field by the open plane. Even in military service, the open cockpit is growing way to an extent that increases the pilot's comfort, and so too efficiency, and thus makes it unnecessary for him to don up in the elaborate harness that was an inescapable part of aviation only a few years ago. In the commercial field the open plane seems to be on its way to join the open automobile as a highly specialized type sold to a few sportsmen who like the feeling of the wind in their faces.

AMERICAN AIRPLANE PRODUCTION: From 1925 to 1929 the number of commercial and private planes produced each year grew rapidly. After the crash of 1929 that proved there was a sharp decline and military production seemed increasing importance. In 1935, however, the replacement program of the budgetary spiritism turned the tide of commercial manufacturing, while the economy policies of the military services contributed to the downward trend of total production. Only 465 military planes were produced last year while 5071 commercial planes were built.

The light plane, selling at \$1,850 or less, has continued to decline in relative importance. In 1931 practically all of that class represented almost half of the total number of units produced. In 1933 they are down to about one-sixth, though of course their slice of pie on the circular chart on page 10 would be a more accurate one if machines of amateur construction as assembled at home from standardized separate parts had been included.

Microplane for military flying

Neither the microplane nor the light plane is gaining definite control in

STUDENT PERMITS BY MONTH. For the first time since 1925 there is indication of an upward trend in numbers of student permits issued each month. The curve for 1933 passed that of 1932 during the past summer and has maintained somewhat higher rates, closing the year at the 1933 level. The figures for 1934 do not include the permits issued to former pilots whose licenses lapsed under the newly-enacted requirements, and the various cases are therefore chiefly comparable.

APPROVAL OF NEW AIRCRAFT DESIGNS. From 1928 to 1930 a progressively larger number of designs were granted approval type certification, thus bringing some 180 in 1928. Since then the number has declined each year, reaching the quite noticeable figure of 48 in 1932. In 1933, however, the A.T.C. procedure continued to decline, and only 35 new designs were approved by the Department of Commerce, a number somewhat less than that called for by normal progress.

the commercial field. From 1928 to 1933 at least as though the microplane were seriously inclined to triumph. It is still improving its position on the whole, but only slowly. More yet but two-thirds of a year's commercial production has been of the single-engine type. Among military manufacturers the microplane's star is slowly in the ascendant. Though complete official figures are not available, it is known that up through 1932 the purchase of the Army Air Corps had risen in any year included as rising as 30 per cent of microplanes. For the present fiscal year, as the latter had, the microplane will almost certainly be a substantial majority. In this respect the Air Corps follows the general outflow of military government the world over, though the tendency has increased much more rapidly in France and very much more slowly

in Great Britain than in the United States. The production of airplanes remains surprisingly widely distributed. There were fifteen manufacturers that were individually responsible for as much as 1 per cent of the total production in 1933, and the ten leading firms combined accounted for only 66 per cent of the total. That shows a slightly more concentration than in previous years, but only slightly. The number of new designs granted approval type certification has continued to fall off, and is now perhaps a little below what should be considered normal, though there is no reason for any such pessimistic number of alterations here as were appearing from 1928 to 1930. There are perhaps nine distinct enterprises of commercial airplanes that deliver recognition, and an average of three or four new designs

NEW STUDENT PERMITS. Since the inception of 1929 there has been a steady decline in the number of student permits issued by the Department of Commerce each year. Although in 1933 we are back to the level of 1928, the difference between the figures of 1933 and 1932 is 11,255 for 1932 is less than one half the drop for any preceding year.

each year in that category is not too many if such manufacturers are to retain their line and modernize their models often enough to be sure to take full advantage of progress in the engineering art and of operating experience. There ought then to be about 32 new approved type certificates in a typical year, and whereas the industry held the A.T.C. production to 48 in 1932, it dropped in 1933 to 35, coming down far below that figure. Engineering departments will want to be able to at least a slightly broader base in the coming year, or some of the manufacturers will be in danger of getting out of step with the times.

of the Department of Commerce has dropped to the lowest figure since the summer of 1930. That last winter, when flying is somewhat reviving, the drop has been due almost entirely to the change in requirements for a private license and to the introduction of a "rule" grade (from recently modified to "unimpaired"). Some thousands of pilots lost their licenses and reverted to student status on the strength of the change in rules, so that the number of pilots on the list at the end of 1933 was average of skill and experience was nearly higher than that of the licensed group as a whole in any previous year. The number of holders of transport licenses remains approximately as for two years past, showing fairly very small gain, and the number of holders of the scheduled air transport rating, qualified to fly passengers over regular routes, has slowly been pushed up to 615. That grade is limited almost exclusively to the usual

present employees of the air transport operators. More important from the point of view of the future of the industry is the number of new men coming in from the bottom, and the number of new student permits issued almost half its own. The figure for new permits, issued, incidentally, excludes entirely the cases of those who reverted from pilot to student status, so the records for the several years are strictly comparable. During the summer the 1933 student-permit record showed well above that of 1932, and the improvement continued through January of 1934, the total permits issued that month showing 34 per cent ahead of the total in the same month of 1933. Obviously, American aviation is determined to get themselves in a position to get into the air as soon as the opportunity offers, even though fiscal obstacles may for the moment prevent their attainment of all their dreams.

ACKNOWLEDGMENT

THE PREPARATION of this pictorial presentation of the progress of aeronautics it has been necessary to seek the co-operation of many organizations and individuals at a time when personnel of more immediate duties were doubly made it difficult for them to comply. Without exception no requests were granted, had to many cases special efforts were made to get

to the Department of War and the Navy, to the National Advisory Committee for Aeronautics, to the officials of a number of foreign governments; and to many individuals who have supplied us with information relating to approved activities or assisted in the completion of material from official sources in the United States and abroad.

Army and Navy Operations

Five-year program levels are not yet reached

The outlook for military and naval aviation has undergone at least two sudden changes within the past year. During the early part of the spring, purchases of new equipment were virtually increased by the incoming administration, and as one year it was impossible to gain any assurance regarding the future. But with the promise of a maintenance at least of present equipment levels came with the announcement of substantial grants of public works funds for new aircraft, and as the final result of all the shifts and adjustments considerably more money is being spent for aircraft and engines during the present fiscal year than in the preceding

one. In the fiscal year 1933, in fact, total expenditures for new equipment dropped to a lower level than in any other year since 1919. For 1933 the promise is for a continuation approximately on the 1934 level, about \$25,000,000 per year—still about 15 per cent below the figures that prevailed between 1929 and 1931.

The result of the reduction lies the 1929-31 level has been that new planes were acquired just rapidly enough to provide necessary replacements, and

with no provision for expanding to fill the gap that still existed between the amount of equipment on hand and the amount that the five-year program for 1926 had projected. In the case of the Navy the gap has been small, though even the Navy, at the last official accounting, was down to 919 airplanes on hand against an authorized 1,000. The Army has never yet been within 10 per cent of its appointed goal of 1,600 machines, and today actually possesses less than 1,600 serv-

FOR NEW EQUIPMENT. Thanks to regular and emergency appropriations the money available for the purchase of new airplanes and engines puts them from the low of \$15,985,000, established in the fiscal year 1919. For 1935 the combined figure for the Army and Navy programs to come is \$23,400,000.

mentary planes according to the latest records (the complete review of the position of the Air Corps at the end of the last fiscal year not being available so far).

Though machines that are not included in the list of service equipment, a very large proportion of the airplanes of both the services have been rendered obsolete by the constantly rapid developments in airplane design over the last two or three years. It is probably safe to say that the Army and Navy together have no more than 600 service aircraft of really good quality in the light of 1934 standards. That implies nothing wrong with the other planes as of the time when they were purchased, but we have been passing through a period of extraordinarily rapid technical development, and practically everything that was built before 1932 must now be accounted as formerly second-hand. To rebuild the service up to the levels established in 1926 and to modernize the equipment in satisfactory fashion would require the purchase of about 1,000 airplanes in each of the next three years. The 1935 appropriations, at least, will not permit of purchase on any such scale as that. Obviously additional appropriations are to be added in new ones, however, to make good the plan situation of Congress to expand the total size of the service's establishments to provide for new conditions. In particular, an understanding is at last being secured to increase the total

number of naval aircraft to allow of planes on the new aircraft carrier fleet and the other vessels recently added to the fleet. Taking account of these prospective extensions, clearly necessary if any naval and military forces are to be kept efficient and to be maintained in that relationship to the armies and navies of the rest of the world which has been established as more or less normal, the requirements seem to be for a total purchase of about 1,600 machines over each of the next three years instead of 1,000.

More flying time needed

Naturally expenses of equipment will be expensive at operation, maintenance facilities, and the like. In 1932, for the first time since just after the War, the amount of flying done by the Army and Navy slipped back below the level of the previous year. In 1933 the Navy is again off by about one sixth from the year before, but the Air Corps returned the ground that had been lost in 1932 and goes beyond to a total of 432,966 hours. The two services are now three approximately 500,000 hours per year with the expanded activities now clearly in prospect, that total should certainly increase to not less than one million hours. Briefly speaking, to give pilots the amount of training they should have to keep fit, every plane in the military service should be flown at least 200 hours a year, and 300 is a much safer average.

Despite the extremely increasing relative importance of air power in mili-

tary operations, the direct and indirect expenditures for military and naval aviation all combined only make up about 16 per cent of the total of the expenditures on national defense. Over the past three or four years that figure has shown no tendency to increase, but it is hardly enough if the new program being developed by the appropriate committees in Congress are to be made realities.

European powers build up

The American tendency to moderate an expansion program for our air forces comes at a point to a great extent in expansion programs on the part of European and Asiatic countries. The British Air Minister has recently indicated that the auxiliary position which he feels his country has been assigned in the air is no longer to be considered as tolerable, and that a building campaign, designed to bring the British air force to parity with that of France must be undertaken. The French Air Minister, however, is planning adaptations of tactics or modernization programs, and it is probably fair to say that policy upon the whole scale of Europe is more preoccupied with auxiliary systems than ever before.

The records of safety for the Army and the Navy over recent years are gathered in the chart on page 75. The really spectacular programs that have been made in the past six years speak for itself. At one time a record necessary to allow, in calculating the rate of replacement of naval aircraft, for an annual loss of 15 per cent by crash. Today the allowed rate has been reduced to only 8 per cent. It need to be considered that there was a differential death record applying to aviation personnel, as against the rest of the service, of at least 3 per cent per year. The death rate among regular flying personnel has now been reduced to well under 2 per cent and improvement still continues.

PERSONNEL. The Army and the Navy approach parity at the total number of trained pilots on their rolls. The Navy, however, shows a much higher percentage of colored men.

ARMY GAINS, NAVY LOSSES. In spite of reduced appropriations all along the line, Army gains recorded by 9 per cent the number of hours spent in the air over their last previous record set in 1931. They gained some 68,000 hours over 1932. At the same time, the Navy cut back still further, dropping below the levels set in 1931 and 1932.

MONEY AVAILABLE FOR ARMY AND NAVY AVIATION. The total funds for military and naval aeronautical operations for 1934-35 were used here tabulating under 1936-37 levels by grants of PWA money for the construction of new planes.

INVENTORY. The number of planes available to the Air Corps and the Navy shows a tendency to decline, a trend which should be reversed during the current year when the effect of PWA money begins to be felt.

World Air Transport

America's steadily lengthening lead in commercial aviation

MILES FLOWN Although all countries record substantial increases in transport-mile flows during 1933, the United States is still far and away in the lead, and the relative positions of the other countries have not changed during the past year. Close to half of the distance flown on the world's airways is covered by ships under American registry.

ARMCHAIR EVIDENCE? Air travel alone seems to have approached a saturation point, whereas our percentage of the airways is still accelerating. The dominance of the United States is proportionate to the passenger-mile flows during the past year.

sell the story. Some of the factors the charts do not show are that the average speed increased on our transport lines is about 40 per cent higher than the average European speed; that the average American transport airplane flies more than 60 per cent further in a year than the average plane of any

European national system—and that in American air transport has been developed and maintained on a consistently competitive basis, with few if more distinct systems offering service between major points wherever that can be arranged, whereas in every European country of importance transport

operation has now been made a private monopoly or sub-subsidized with a liberal government subsidy.

Index for our money

We have made no attempt this year to give the economic comparisons that have featured the past Record-of-Transport issues of *AVIATION*, as the devaluation of the American dollar has made it impossible to determine a fair basis of comparing American expenditures over the past year with those made in the currency of other nations. In general terms, however, any reasonable method of comparison that might be used leads once more to conclusions as favorable to the American operation as in the past. Last year we could give it with figures "that the American taxpayer gets more return in actual transport service rendered for every dollar put in circulation by the government than does his fellow taxpayer everywhere in Europe, and more than twice as much as in any other country except in Great Britain." In general terms, and with possible reservation with respect to The Netherlands where speculation has been exceptionally economical, that is still true as written last spring.

Rather curiously, once it was in the

United States that carrying the mail was first taken in the private hands of an airline, our lead over the rest of the world on mail and cargo is much less pronounced than on passenger traffic, but that is because European transport companies have had a special advantage in developing an express traffic so that they could successfully facilitate the clearance of parcels at international boundaries and thus the competitive express service rendered by rail and ship was almost incredibly slow and exceedingly subject to loss and pilferage of goods. In our domestic traffic, aviation has no such unique advantage, and the growth accordingly has been much slower, but even so the present total air mail, and the total for all the European nations is approximately 3,350,000 tons-value, while the leading country in Europe is Germany with 900,000 tons-value, and the total for all the European nations is approximately 1,200,000. Apart from the record made in the United States the western side of the Atlantic has provided some very interesting and suggestive comparisons with "fast freight" in Canada, where the terrible slowness of transport to remote mining camps and trading posts has made the airplane the standard vehicle of heavy

transport, and has built up a freight traffic of approximately 750,000 tons-value a year.

America leads in private flying

Though private aviation is in some respects less vigorous in the United States than in Great Britain, partly because of the compactness of the British Isles and the consequent ease and frequency of communication among private pilots all over the United Kingdom, in their numbers of planes, privately owned and also in numbers of pilots, America stands first. Our per capita ownership of civil airplanes, including transport medium airplanes, is more than twice that of any European state. As for pilots, approximately one out of 1,300 Americans makes between the ages of 15 and 60 hold a currently valid pilot's license or student permit. Not even in such countries as Russia and Germany, where there has been a most enormous and disordered government propaganda for mass participation in aviation, has any such ratio been attained—unless there has been a truly enormous expansion in Germany during the past year since the last official figures on licensing of pilots and planes became available.

PASSENGER TRAFFIC In terms of passenger-miles, the United States leads in even stronger relationship to the rest of the world than in miles flown. A study of the relative standing of the several countries in the two charts indicates that Great Britain enjoys the most balanced use of its equipment.

Each symbol represents 5,000,000 passenger miles flown in 1933.

What the charts do not show
So far as volume of operation is concerned, the charts on these pages

Airports and Airways

Airways take a cut, airports a boost

FOR AN AIRLINE in the Department of Commerce under the new budget for airway development and aircraft regulation continue to decline. By an extensive comparison of forecasts and previous forecasts (see *Airways*, November, 1955, page 314), economists have been adhered to percent reduction to be assessed on with little loss of efficiency for airway development. It is particularly important with the funds available to undertake much in the way of extension for the federal airports system. The more that can be hoped for is that the existing facilities can be maintained satisfactorily at their present levels. At one time during the latter half of 1953 the lighting and radio systems on certain sections of the airways were awarded by departmental order, but as it became apparent that such a move might constitute a threat to operations, the order was rescinded and the former facilities were retained. At the present time the total mileage of lighted airway stands at about the same figure as for 1952—just short of 26,000 miles.

The airport situation is drastically more encouraging. Where in 1952 both municipal and commercial fields recorded a reduction from the high point attained in 1951, both categories show a decided pickup in 1953. The latter comes of the Department of Commerce gives the total number of fields in the commercial United States as 2,116. Classified as follows: municipal, 598; nonmunicipal, 680; intermediate, 269; military, 479. Army, 25; Navy, 18; miscellaneous, 85. The intermediate fields in the above classifica-

EXPENDITURES FOR AIRWAYS AND REGULATION—Money available for Department of Commerce activities work has leveled off at about 152¢ figure. The 1953 figure represents budget estimate.

tion are the only ones to show a decrease over the 1952 figure. This is not unexpected, however, for many intermediate fields are frequently converted into or into the commercial or municipal category.

Of interest in the accompanying curve of total airports. For two years the number of total fields counted along with a national figure, increasing between Jan. 1, 1951, and the same date in 1953 from 6 to 26. In the first six months of 1953, however, the number was reduced to 202, and rounded up the year with 294.

This phenomenal increase came about through a change in rating policy on the part of the Department of Commerce. It was formerly the practice to send inspectors into the field to rate airports only upon application of the owners. During the first part of last year, however, the department initiated a country-wide inspection program, and sent groups of inspectors into designated territories to catalogue the rating of landing fields. At the same time certain of the requirements were modified somewhat in view of the general economic situation. The response to the program is apparent from the curve. During the

latter half of the year, funds available for the work dwindled and the number of ratings stopped off rapidly. At the moment, no money has been appropriated for the program, and the work is at a complete standstill.

About the first of December, the Department of Commerce announced a new airport program which should boost the reasonably current figure for activity reports during the current year. Some \$10,000,000 of Civil Works Administration money was earmarked for the construction of 2,800 auxiliary landing fields. The money went to put a large number of men to work immediately, but the secretary noted (assuming that the program is carried through to its intended conclusion) will be a tremendous increase in intermediate landing fields and small airports. Within a month of the announcement, some 450 projects had been put under way in 41 states, of which approximately one-half involved improvements in existing airports and the other half the construction of newly new fields. The airports program is an important adjunct to the effort to encourage private flying through the development of a low-priced airplane for popular use.

AVIATION
March 1954

Air mail investigation

ABOUT the middle of January the seasonal investigation of the air mail situation slipped into high gear and accelerated at an amazing rate. Chief Inspector Hugo Black was assisted by witnesses that some time from the Postmaster General's office had been barred (just prior to the time that the new administration took over) that this case was somewhat hounded when ex-PMs Brown produced for the committee the papers that had recently been burned.

Clearly alluded to the episode of the Hoving Project was the new lawsuit McCracken-Strine-Houder. The committee subpoenaed the files of ex-Secretary of Commerce William McCracken for examination, the latter, acting on the principle that one of the first duties of an attorney was to protect the privacy of the records of his clients, would all occurred first provision to have the papers sent to the Senate. Two clients, Col. I. H. Brown, executive vice-president of Northwest Airways, and Gilbert Strine, representing Blount Air, Inc., of Western Air Express took exception to visit the McCracken office and removed certain papers which they claimed were of a purely personal nature. Col. Brown delivered his by telephone and putting them in his briefcase. Strine, however, he had responded together and produced again his by Department of Justice operation, but the Western Air letters were never turned over to the committee. The Senate, charging that McCracken was a lobbyist and could not clear the privilege of an attorney in this case, ordered the action be taken together with Brown, Blount and Strine. The latter three submitted to arrest, but the former, protesting that he had acted in good faith within the legal rights, and questioning the right of the Senate to detain him, was brought to trial only after a Gilman-Sullivan man-laws through the aid of Washington. McCracken and Strine were convicted and sentenced to six days in the District of Columbia jail. Col. Brown has already served his term. But McCracken has carried the fight to the Court of Appeals and has been released as pending the final decision.

Later, before the case was brought down to this level, the House bill which completely gutted the airmail act would. Acting on the belief that

the summary trial before the Black Committee, together with investigations of his own, indicated that the air mail contracts had been obtained illegally, Postmaster General Felt ordered the indictment of all domestic route contracts effective midnight Feb. 19. The Army Air Corps was ordered to prepare itself to take over the airmail of the mails on that date.

When the shockheaded military had recovered its breath sufficiently to become articulate, a flood of protest poured into Washington. Not alone the operators, who saw themselves ground out away from beneath their feet, but a large share of the public outside the industry set up indignation demands for specific charges against the legality of the contracts, and protested the right of every American citizen to a fair trial before condemnation. Among them, Col. Charles A. Lindbergh went President Roosevelt a plea for a fair hearing for the airmail. A nationwide controversy was precipitated when the only reply reached the Colonel was a curt rebuke from a White House secretary charging "public-safety" because the indictment had been published without of legal sanction. Public opinion on the incident, judging from telephone and other messages received in Washington, was about equally divided between the administration and the Colonel. [Hereafter, a note of ten to one for the administration on any public question had been a last resort, even in the case of reconstruction, however, the airmail industry turned a deaf ear. It has been widely quoted that the Post Office Law of 1921 has been violated, under which every a contractor whose license to carry U.S. mail has been once revoked

is expelled from bidding on any government business again for a period of five years, a move which might easily prove fatal to the existing airmail. At the moment, however, there is some indication that legislative steps may be taken to remove this indignity and to permit present operators to bid on a revised schedule of payments based on a new contract.

Five days after the abrogation of the contracts, Postmaster General Felt issued an open letter to Senator Black stating that justice for the government's interests for the indemnity action without the process of law. It stated that the fact had not been brought out previously before the committee, reducing at least length the charge that the present contracts had been drawn up in a secret session of Post Office and Air line officials, and that they were the result of collusion and conspiracy rather than of open competition bidding as was the intent of the McNary-Wittman Act.

Protesting that race protest was of an avoid legal machinery was put in motion by Transportation and Western Air. A "show cause" order was obtained from the Federal Court of New York, but three days later a motion for an injunction restraining Postmaster General Felt from putting the contract amendment into effect was denied by the same court, reason—non-jurisdiction based on the well-established legal rule that the government cannot be sued in its own courts. In the meantime other operators refused payment from any public announcement of plans, steadily awaiting developments. [Presumably and legal steps being taken, the carrying of domestic air mail by private contractors issued on Feb. 18, at ordered (see page 36).]

AIRPORTS The number of total airports in the United States showed a decided pickup in 1953 under the impetus of new Department of Commerce policy, but tapered off as funds ran low toward the year's end.

Mr. Brown stated that no contracts, extensions, or anything else were left by agreement arrived at in the meeting, which was held for the sole purpose of discussing but not actually making a contract. The meeting was held in a postscript and mail operations running parallel lines as to the controversial questions of power rights in those territories. In reply to the charges of illegality in connection with Second Air Force Personnel General Glover's extension of contract for six months, in testimony in May, 1950, Mr. Brown quoted from the general statute applying to mail contracts, which provides that six months extensions may be granted on mail contracts for a limited period of four years, in the opinion of Post Office officials, it is considered the best thing for the postal system. Mr. Brown also stated that he had been in contact with his own idea of basic law and the provisions of the McNary-Waters act, and that his policies met with the approval of President Hoover, who left specific details of Post Office management to his Postmaster General.

Mailed mail

Mail routes, conditions, lack of proper mail equipment, and uncertainty with food and mail services were a few of the problems confronting Army operations when they took over air mail operations on Feb. 18. Shortly afterwards after the end of Feb. 9, the Army Air Corps prepared an order it could in two days for the highly specialized job of carrying out an air mail service as ordered by the Post Office Department as the most efficient at the 26 of the airports listed. Major General Benjamin B. Boudin, Chief of the Air Corps, immediately turned over to the Post Office service 140 planes, largely transports, with mail load capacity, attack, and observation types and a few cargo planes, as well as 200 flying officers and an enlisted personnel of 324 mechanics and support. To convert these military aircraft into planes of air mail service was no other, more efficient manner. Mechanics worked day and night, tearing down mail mail, and everything else distributable from cargo trucks to make room for mail bags. Mail-flying instructions were written, and an attempt was made to provide the planes with necessary radio sets, but this was in some cases since many Army planes are not adapted for commercial types of radio equipment. "Bugs" in the equipment were not flying hours, and evidenced by the fact that they had not been trained in the type of flying now conducting them. Army pilots covered mail routes, protected blood-flying, and test flights.

While planes were being adapted to mail service and pilots involved in the mail routes, the operations were divided into three zones: Eastern, Central, and Western, and zone commanders were appointed, each with

blockade authority to call upon any Air Corps personnel or equipment in his zone. The Eastern zone comprises routes between Boston and Miami, and as far west as Chicago. Though Newark airport was designated as its mail terminal, facilities for emergency administration quarters were found to be inadequate, and the Eastern headquarters were hurriedly transferred to Brooklyn at the Floyd Bennett Municipal Airport. The Western zone, taking in all territory west of Chicago, based its headquarters at the municipal airport at Salt Lake City. Chicago's municipal airport was made the base of mail-terminal operations. The Central zone, which included approximately 40,000 miles are covered daily by army planes, making 60 trips. Of these, 36 are made in the Eastern zone, covering 20,000 miles, 26 in the Western zone (11,000 miles), and 12 in the Central zone (3,700 miles). Additional mail will be placed in operation as fast as personnel and equipment are transferred and routes worked out.

The gravity of the situation, intensified by winter storms, became immediately apparent. Before the first mail run at mid-day on Jan. 22, three Navy Reserve officers were killed while flying to their planes. The fatality toll was raised to six during the first week of operations. This toll included with mail to Ohio, while ferrying a ship in Texas, and a third was drowned when a blizzard overtook the amphibious ship was carrying last from New York to Virginia. These casualties plus several serious accidents to personnel and planes, as well as mishaps at a late first mail route, precipitated better attacks in Congress against the administration's method of dealing with the emergency. A resolution providing for membership Congressional investigation of the emergency was introduced in the Senate. In the House, a resolution was introduced in the House by Representative McLean of Wisconsin in spite of heated Republican opposition, however, the House passed the Emergency Air Mail bill late in the session. The President General is the President General of the Air Corps, and the House provides for the transfer of the unexpended balance of the current air mail appropriation in the War Department to finance the Army and service.

Army pilots and ground personnel will receive the usual \$5 per day "travel" allowance while on duty away from their stations. Even with this additional allowance, Army pilots' pay is substantially less than salaries paid to commercial pilots. Nevertheless, few applications were received by the Air Corps from pilots and co-pilots who had lost their jobs as a result of the termination of private contractors' schedules. While hundreds of Air Reserve officers without air mail experience offered their services. The

acceptance of such offers is conditional upon future determination of policy.

Though most of the former operators' mail mail contracts were cancelled on Jan. 18, the Army Air Corps is to assign services to a greater or lesser degree. United Air Lines and American Airways announced that their schedules would continue to maintain regular mail and Western Air ferried all its employees, effective on Feb. 28, back to a return force to be air transportation. Eastern Air Transport put into effect outdated schedules, resumed night-flying. United States Airways announced that it would continue to fly its mail and other operations provided it continued in a mail carrier. Northwest Airways offered to sell out to the Grant Aviation Co. of Portland, Ore., on Feb. 28, but the latter announced the confirmation of its schedule. Officials of the New York, New Haven & Hartford Railroad advised that proposals had been submitted whereby a new airline between New York and Boston would be established as a connecting line between them.

Legislation after shock

Immediately upon the abrogation of the mail contracts, the Post Office Department submitted to Congress a bill authorizing all details of the War Department's agencies of mail routes (see above), and containing provisions for short-term mail contracts with private operators which would be renewed on a basis in the event of House and Senate discussion. The original clause authorizing the Postmaster General to make contracts for three months or more than 48 cents per plane-mile was deleted and alternative proposals were considered. One amendment offered by J. C. O'Halloran, registered from spokesman for the Post Office Department, would permit holders of cancelled contracts to bid again on routes to replace the Army Air Corps planes within the six years required by existing law. Turning from denunciation to constructive Senator Frank P. Westminster General Post Office set to work to devise a new financial structure for air mail to replace the one currently being destroyed. One present plan proposes to convert air mail operations to joint companies which would be regulated by the Interstate Commerce Commission. With the government keeping check on operators' books, the Post Office Department would put out as a subsidy the exact sum operating loss suffered by each company every month, equivalent of the amount of aid granted. To permit an opportunity for profit, the legislation would provide that, in no case would the gross payment be less than the net income to the operator. The amount of the aid would be based on the air mail placed by each line.

Before the mail investigation had

reached the point of contract cancellation, mail was extended on the House bill was introduced on the floor by Thomas S. McNamara, designed to make air mail gradually self-supporting while preserving the government's involvement in developing commercial aviation. Features of the bill were the proposal to cut a 3-cent air line-rate and a special 2-cent point, as well as a flat rate of 25 cents a mile at the end of the 18th year. The Postmaster General would make the books of contracting operators at least once each year, with a view to reducing government payments when large profits are shown. As compared with the McNamara bill, the Kelly bill of 1951 proposed that air mail contracts should be paid for at a annual base rate of 2 cents per plane-mile and that payment was never to exceed 50 cents a mile. To insure against net self-subsistence on additional payments not to exceed 25 cents per mile would be paid at the discretion of the Postmaster General, flat payment to terminate in 1958.

Chairman Reed of the House Post Office Committee also came forward with a bill after the committee was immediately disapproved that introduced by McNamara except that a slight variation in the method of payment was proposed. Reed proposed a flat rate of 25 cents a mile at the end of the 25th, 28 cents for the second 25th, and 3 cents per mile for all remaining. He tried also the extension, at higher rates, of air mail service to Hawaii, Alaska and over possessions in the West Indies.

Some days later, after a plethora of proposals in different forms air mail

contracts were, and a measure to the operation of 48 cents per mile for the first year. This rate and premium would be added every 5 cents each year, until they became established at a flat rate of 25 cents a mile at the end of the 18th year. The Postmaster General would make the books of contracting operators at least once each year, with a view to reducing government payments when large profits are shown. Airway investigations

Following through a web of charges and counter-charges, and a mass of constantly conflicting testimony offered by experts and non-experts, the McNamara bill was introduced in the Senate by the McNamara bill. The McNamara bill empowers the Post Office Department to contract for the use of space in a transport plane, whether or not it is filled, with the new laws provide for compensation for service actually rendered on a plane-mile basis.

Following through a web of charges and counter-charges, and a mass of constantly conflicting testimony offered by experts and non-experts, the McNamara bill was introduced in the Senate by the McNamara bill. The McNamara bill empowers the Post Office Department to contract for the use of space in a transport plane, whether or not it is filled, with the new laws provide for compensation for service actually rendered on a plane-mile basis.

HIGH, WIDE AND HANDSOME

Heavily used of the high altitude and commercial service of the air transport industry was presented at New York when the McNamara bill was introduced in the Senate. The bill was introduced in the Senate by the McNamara bill. The McNamara bill empowers the Post Office Department to contract for the use of space in a transport plane, whether or not it is filled, with the new laws provide for compensation for service actually rendered on a plane-mile basis.

THE BUYERS' LOG BOOK

AVIATION's Card Index of New Equipment

This department is equipped to help render inside information of new parts, accessories or materials

AIRCRAFT EQUIPMENT

Conduit String

The Pyle-National Company,
1311 North Koster Ave., Chicago, Ill.

NEW FORM of flexible conduit string has been developed especially for wiring up motors and other electrical equipment. Several patterns, sizes, shapes, etc., where an explosion hazard exists. Flexible, easily installed. Tested to 500-lb. hydraulic pressure. Under writer's Laboratories rate it for Class I Group II and Class II Group G hazardous locations.

AVIATION, March, 1934

SHOP EQUIPMENT

Lamp guard, portable

Georhies Manufacturing and Supply Company,
1311 West 54th Street, New York, N. Y.

FULLY machined, non-breakable, guard for portable lamps for shop and hangar use. The guard is made of a high electric compound, surrounding a reflector or eye-shield. Handle of soft rubber with guard to a connect unit. Keyless switch, rubber cord, rubber plug. Tests 25 to 50 watt with type lamps. Cannot short or flash out in case fire or explosion.

AVIATION, March, 1934

MATERIALS

Aluminum solder

Ketter Solder Company,
4311 Weymouth Avenue, Chicago, Ill.

FULLY filled solder for aluminum has been announced. Like other Ketter solders, the new aluminum solder is an alloy with a hollow case filled with the filling material. It is put up in small spools in tin for small shop use, and also in one pound spools for commercial and industrial use such as motor and electrical manufacture and repair, airplane maintenance, etc.

AVIATION, March, 1934

MATERIALS

Dopes (catalog)

Timber, Inc.,
Dumas, Texas County, N. J.

TARRANT is the history, manufacture, specifications and uses of dopes and finishes for aircraft is available. Instructions are given for the preparation of all types of dyes, stains, wood, metal or fabric, exterior and interior—and also the details of the finishing process. Includes specifications for dye stains, analysis of finishes, color test of TARRANT products, etc.

AVIATION, March, 1934

PARTS

Bearings (catalog)

Norm-Hyattum Bearings Corporation,
Stanford, Conn.

A COMPLETE line of precision ball bearings designed especially for aircraft outside covers by using Ford's Constant Description, standard operations, and load ratings of the types of ball bearings commonly used. In addition, a number of drawings are included which show a wide range of typical applications. Copies are available on request.

AVIATION, March, 1934

SHOP EQUIPMENT

Lathes (catalog)

Smith Bros. Lathe Works,
Smith Bros. Ind.

LATHES of all types for production, maintenance and machine shops are included in Catalog No. 94. Lathes are available in all sizes from 9 in. to 36 in. swing arranged for water or belt drive. Built to bench or long-stroke styles for both high precision and heavy production duty. Catalog also covers lathe tools and accessories. Copies available on request.

AVIATION, March, 1934

SHOP EQUIPMENT

Profile gages

Jackson Profile Gage Corporation,
161 Jackson Street, Lowell, Mass.

STOCKED profile gages consist of a series of slotted measurement (total from .002 to .018 in. thick) held together by adjustable clamps. With clamps loosened, gages may be set to conform with any desired profile; then clamped tight to form a permanent or temporary template against which drawings or other parts may be checked. Adapted to wide range of uses. Catalog available.

AVIATION, March, 1934

SHOP EQUIPMENT

Small tools, handwork

The Stanley Works,
New Britain, Conn.

A NEW set of hand tools for automotive and aircraft work has been made of a new refined composition which is very tough and resilient. Cutter body is steel with bakelite handle. Composition bars are fitted into steel body. When worn, they may be renewed by inserting all old bars with a pipe wrench and driving into steel into modern in hand.

AVIATION, March, 1934

Streamline Wheels and Brakes

These wheels were developed to meet the conditions imposed by tires of a new design. This condition involved design to meet a predetermined form with a resultant maximum of strength and minimum weight within that form. Brake development, though incidental, was along similar lines, in that maximum controllable power with minimum weight was sought. These structures are a valuable addition to the reduction of parasite in fixed landing gear.

Streamline Tail Wheel Knuckle Assembly

A series, divided into two parts, designed and built to meet Air Corps tentative standards: 8 and 10 1/2 inch diam. steerable, as well as unsteerable 360 degrees for ground handling. Larger sizes unsteerable 360 degrees, but not steerable. All sizes damped to prevent shimmy. Developed by the Air Corps in the quest for reduced parasite and tied with streamline tail wheels and tires.

Bendix Pneumatic Struts

The result of more than three years careful research. Designed in each case for the particular structure into which it is to be fitted. A development carefully worked out to give maximum shock dissipation for maximum load on the structure, and maximum comfort in taxiing with minimum weight. Can be designed to operate on any one aircraft, both for landing gear and tail wheel work.

Bendix Standard Pilot Seat

Developed to meet both U. S. Army Air Corps and U. S. Navy, Bureau of Aeronautics, requirements. Designed to reduce service struts to a minimum by the use of a single seat. Utilizes latest knowledge regarding forming of aluminum alloys, the use of electric welding and of special machinery. This seat has passed all tests and weighs, completely painted, six and one half pounds, a major reduction in weight.

BENDIX PRODUCTS CORPORATION

AIRPLANE WHEEL AND BRAKE DIVISION

SOUTH BEND, INDIANA

(Subsidiary of Bendix Aviation Corporation)

TEXACO AVIATION PRODUCTS rank high in the confidence of flying men. For many years they have stood for greater safety and reliability in the air, and for the economy of all round effective performance.

Texaco Airplane Oils, for example, are highly refined to give dependable service under all flying conditions and temperatures. They are full-bodied and heat-resisting. They will not break down, this out or form hard carbon. With Texaco en-

gining through your engine, you know pressure will stand up! Its performance on the ships of many of the major air transport lines is proof of this. Texaco lubrication is effective lubrication.

Consult an experienced Texaco engineer about your fuel or lubrication problems. Ask him

about Texaco Airplane Oils, Texaco Mafak Greases and Texaco Aviation Gasoline. He will gladly place himself at your service. Texaco Products are available at major airports everywhere. Write The Texas Company.

AIRWHEEL

TIRES AND BRAKES make any field a landing field

WHEN you fly you must always face this fact—sometime you may have to set your ship down quick in the first clear space that offers.

You won't have any choice then, so it is wise to choose now the dual protection that only Airwheels and Airwheel Hydraulic Brakes afford in landing in to muddy, rough or even plowed ground—

Safety in landing—These great soft yielding rubber cushions swallow bumps and jolts—landing and taking off with hardly a jolt under conditions impossible with ordinary tires.

Safety in braking—Airwheel Hydraulic Disc Brakes have approximately 400% more braking area than a comparable size hand type brake. They are sure-acting, non-fading, instantaneous-releasing—the most positive brakes ever used on an airplane!

Just one emergency landing, in a place that looks o.k., may cost much more than a whole set of Airwheel Tires and Brakes. That is why the leading transport lines are adopting them as standard equipment. How about you?

For complete data and prices write to Aeronautics Department, Goodyear, Akron, Ohio, or Los Angeles, California.

COMFORT..

..in AIR
TRAVEL

WITH the advent of high-speed transport, more, with its resulting discomfort to passengers, has given Sperry research engineers an opportunity to put their theories for its elimination into practical use. They have already applied acoustical and soundproofing treatment to a number of transport planes, and in the cabin of the new Douglas the noise level has been brought down to that of a Pullman.

A spin sickness and uprooted chair are inadequate for complete comfort. The Sperry Pilot for Automatic Flying has the ability to detect the slightest divergence in flight attitude, and the contrast as stability and control when it is in operation is the most convincing evidence of its superiority over hand control. The Sperry Pilot is not used for takeoffs or landings, but once the plane is in the air, the human pilot is relieved of his most arduous task—the effort of holding the plane on its course by constant manipulation of rudder, aileron and elevator controls.

The forty-two Douglas transport planes comprising Transcontinental & Western Air's new fleet will be soundproofed by Sperry and equipped with the Sperry Pilot for Automatic Flying.

SPERRY GYROSCOPE CO., Inc.
BROOKLYN — NEW YORK

The Choice of Two Hemispheres

THE ability to produce aircraft which fulfill the difficult requirements of flight instruction, is the primary reason for the preeminence of Consolidated training airplanes in the U. S. Army Air Corps and U. S. Naval Air Service. This leadership has been maintained for the past ten years by constant improvement in design, manufacturing methods and materials, as exemplified by the new convertible "primary-co-advanced" Military Trainer now used by the Army Air Corps, and by the new Fleet models which have received world-wide recognition. Consolidated airplanes have been purchased by the Governments of • Argentina • Brazil • Canada • China • Colombia • Cuba • Mexico • Peru • Portugal • Rumania • Spain • Spain and • United States.

THE ONLY 4-Passenger Cabin Plane Built to "Airline Transport" Standards

THE NEW STINSON RELIANT FOR 1934 IS AN "AIRLINER" FOR THE BUSINESS MAN AND COMMERCIAL OPERATOR

Stinson Leads—

IN SALES

Outstanding sales were responsible for the fact that the 1933 Stinson Reliant outsold an assortment of new, four, and six-passenger cabin planes constructed since its introduction in May, 1932! Before now, such decided preference shown for any make of plane.

IN SAFETY

With more Stinson Reliants flying in 1933 than any make of four-passenger cabin plane, not a single person was injured and only one Reliant was damaged, in a landing due to heavy fog. This is a tribute to Reliant Flyers and is definite proof of safety.

IN RELIABILITY

By flying more than 50 million miles on single engine and tri-motored planes in the United States, Alaska, South and Central America, Europe, the Philippines and other countries, the Lycoming Transport engine has been proven. 100% RELIABLE. More any motor of its power class.

The New Stinson Reliant

The new 1934 Stinson Reliant, four-passenger cabin plane, offers many new mechanical features and comforts previously found only in Airline Transport planes, or in planes in the \$10,000.00 price class.

The new Reliant provides the utmost in reliable cross-country transportation, with the safety and precision of the modern Airliner, and at operating costs comparable to motor car travel.

The Reliant is the only four-passenger cabin plane built by an organization which also manufactures Tri-motored Transport planes which have proven their reliability in 20,000,000 miles of scheduled Airline service.

Only in the Reliant do you obtain the Lycoming 225 H. P. Transport Motor, whose reliability has been amply proven by 60,000,000 miles of flight in Airline and private service. No other motor of this horse power has ever flown so far. Because safety in an airplane depends particularly on the reliability of the motor, you will be wise to demand that the motor which powers your plane be proven by "Several million miles of regularly scheduled Airline Service."

2,000,000 MILES ON KENDALL

Without a Single Engine Failure Chargeable to Oil!

HERE is just one proof of Kendall's quality... just one expression of the high esteem in which so many pilots and airmen hold Kendall, the 30 Hour Oil, today!

There are thousands of others. For Kendall just naturally seems to make records, just naturally seems to make lubricating news. And for good reason. Because Kendall is distinctly the quality oil of aviation. Every drop of it relieves from the conflict made in the world... Bradford Grade of Pennsylvania. Every drop of it refined by special processes to eliminate its native purity and richness. And every drop of it sure to give full-bodied, dependable lubrication that means outstanding performance under almost any conditions.

Kendall, the 30 Hour Oil, famous for its fine quality whenever planes are flown, is available at leading airports throughout the country in specially-stocked cans.

Again selects the Western Electric Radio Telephone

For its new Lockheed Orion and Electra, Northwest Airways has selected Western Electric 2-way Radio Telephone. This choice was only natural—for Northwest's experience with Western Electric apparatus has been long and satisfactory.

The new Electras will be equipped with Western Electric 12A Receivers and 11A Transmitters for their wave communication, and with 11A long wave Beacon Receivers. The Orions will also carry Western Electric 2-way Radio Telephone equipment including the new 12A Receivers.

Western Electric equipment is standard on all of the nation's major airlines. You'll find it in all planes flown by American Airways, National Parks Airways, Northwest Airways, Pennsylvania Air Lines, Transcontinental & Western Air, United Air Lines and Western Air Express. The unanimous choice of these leading operators is convincing evidence that Western Electric leads in complete 2-way Radio Telephone Systems.

For full information, write to Western Electric Co., Dept. 255 A, 195 Broadway, New York, N. Y.

One of the new Western Electric equipped Lockheed Orion—on Northwest's routes, along which there are 14 Western Electric equipped ground stations.

ROMECS CONTRIBUTION to SAFER-BETTER FLYING

Prevention of Vapor-Lock

The Romec Fuel Pump is a positive, rotary type pump which pumps vapors as well as liquid.

While gasoline may not be prevented from vaporizing, the Romec Pump prevents vapor lock, because it pulls the vapor through as well as the fluid.

It will do what a piston pump will not do—pump fluids while boiling.

Planes equipped with Romec Pumps do not have trouble with vapor lock. The pilot is assured that his engine will get fuel.

Recognized as necessary and standard equipment by the largest transport lines, the army, the navy, and the coast guard.

Romec also builds vacuum pumps for aircraft gyroscopic instruments, and oil pressure and vacuum pumps for scientific pilots.

ROMECS PUMP COMPANY
ELYRIA OHIO

Kollsman for Precision

KOLLSMAN SENSITIVE ALTIMETER • TYPE 76-01

The position of the Kollsman Sensitive Altimeter was demonstrated the first time in Major James Doolittle's "blind flight" experiments in September, 1933. Its dependability under the most adverse conditions was proved in Wiley Post's "around-the-world flight." In thousands of planes it is an indispensable factor of safety.

Recognizing the importance of such an instrument, the U. S. Air Services have adopted the Sensitive Altimeter as standard equipment, and the Department of Commerce requires its use on every Air Line passenger plane. Consequently, the Kollsman Sensitive Altimeter is in service on the airplanes of 25 air transport companies and it is found on the instrument panels of practically all U. S. Army and Navy planes. Foreign Governments as well as private pilots

the world over are becoming increasingly aware of the outstanding qualities of this unique instrument.

It reads like a clock—large pointer in hundreds and the small pointer in thousands of feet. It is adjustable by a barometric pressure scale, or by markers along the altitude scale, available in ranges of 20,000 ft., 35,000 ft., and 50,000 meters; also in order in ranges of 50,000 ft. and 16,000 meters. Barometric pressure scale graduated in inches or millimeters of mercury, or in millibars. Standard mounting. It combines the functions of four instruments—high range altimeter, landing altimeter, level flight indicator, climb and descent indicator. *Write for the Kollsman Catalog.*

DEEP AIR

In the passenger seats they talk of it being "a long way down." But up front, the pilot who has worn out a dozen pairs of breeches in assorted cockpits knows it's not. It is a long way up. We deep-air fish never swim far above the bottom of our ocean. Five thousand feet altitude isn't much; neither is the normal margin of superiority of Ethyl Aviation Gasolines. But they both seem like a lot when you need them and haven't got them. Ethyl Gasoline Corporation, New York City.

BUT--I haven't \$10,000

"That New Beechcraft is a sweet airplane. The way she performs in downright economy, I'd even trade my wife to fly that ship. . . . You bet, I would like to own it, could use it in my business. But I haven't \$10,000 to spend for an airplane. . . ."

That's what they all seem to think when they first see this New 225 H.P. Beechcraft--"too high priced!"

We tell them about its low maintenance cost--show them that the cost per mile is *fractionally less* than the mileage cost of other forms of transportation.

But always the conversation comes back to the initial cost. If, however, you handed us a \$10,000 bill for one of these New Beechcrafts, the change we would give back to you would buy an ultra modern automobile.

If you are interested (in the Beechcraft, not the automobile) ask your secretary to ask us for further information.

The Beech

PIONEER INSTRUMENT ENGINEERING

It is the policy of Pioneer Engineering, not only to produce reliable instruments to meet the exacting requirements of current aviation, but to adequately provide for anticipated progress and development. Tireless research, additional refinements, exhaustive material, temperature and service tests are continuously exercised in an effort to increase the efficiency and stamina of each individual Pioneer Instrument. Fifteen years' experience in the handling of this particular phase of engineering; the most modern plant and testing equipment; a personnel composed of specialists in each field of production, have combined to assure the uniform quality of Pioneer Instruments.

BROOKLYN, NEW YORK • A SUBSIDIARY OF BENDIS AVIATION CORPORATION

A training as broad as leadership can make it

GRADUATES of the Boeing School are trained for the future of aviation.

The resources of United Aircraft & Transport Corporation have been drawn into their ground and flying instruction. These resources, unparalleled anywhere in the industry, include the manufacturing and assembling experience of the Boeing, Sikorsky, Chance Vought and Stearman Airplane Companies, Hamilton Standard Propeller and Pratt & Whitney, manufacturers of Waco and Hornet airplanes, together with the fleet flown out of United Air Lines' 50,000,000 miles of mail-and-passenger transport experience.

The ground-work for aviation's future development can come only from a body of practical experience such as this. The best way to be prepared for the future of this industry is to be Boeing trained.

Ask any aircraft pilot, or Boeing graduate. In addition, we will be glad to send your copy of the illustrated Boeing Bulletin, giving accurate requirements, flying conditions at the Oakland Airport (all-year flying weather), courses and their costs. Just fill in and send the coupon.

FACTORY EFFICIENCY ON OVERHAULS AVAILABLE TO FRUIT & WHITNEY ENGINE OWNERS

Special precision tools are used for gauging parts

• Every tool and device known to modern engineering is used in the overhaul of engines.

Fratt & Whitney engine overhaul service has been developed from the best practices of factory and field.

A Fratt & Whitney overhaul is an complete and efficient in the most modern facilities now available.

Fratt & Whitney engine overhaul shop.

In addition, all suggestions from outside shops are invited and will of general successful are incorporated.

KIRKHAM SERVICE

• • • • UNDER PERSONAL SUPERVISION OF CHAS. B. KIRKHAM

*Design, Development, Production—whether of the
complete Airplane, Engine or Component Parts*

Above, the Working Room.
Center, Right, Left, Design
area. Below, the Inspection
Department.

Above, the Engine and Planning
Department. Below, the pre-
liminary, structural, and
flight testing department.

**DESIGNERS and ENGINEERS • AIRPLANES • ENGINES
• AIRCRAFT PARTS • CONTRACT WORK • HEAT TREATING •
CADMIUM PLATING and ANODIZING • MACHINING •**

"We offer the facilities of a large, up-to-date and completely equipped plant under the personal supervision of Charles B. Kirkham, President, general designer of aircraft and engines and supervisor of many widely used aircraft parts, and with a staff of experienced specialists in aircraft and engine design and construction."

You will find Kirkham service prompt, efficient and expert in all its branches. Let us help you in your development work, or quote you on your next contract production job. All instructions sent, of course, strictly confidential."

CONTRACTORS TO THE U. S. ARMY

Just a word to the **WIVES** and **SWEETHEARTS**

YOU'll appreciate the Bellanca ideal in airplane design and construction much more than that kind, strong, livable, growing-up lot of years. . . . An airplane must be fast—but speed alone is not enough. It must be able to travel in high speeds but also give you safety. . . . Bellanca offers speed up to three miles per minute in a design that has won every efficiency contest in which it has ever been entered—that has made eight successful cross-country flights—that has held more endurances and long distances flight records—designs in which sportsmen, business executives and officials of the United States and foreign governments are found hundreds of thousands of miles each year in complete safety under all kinds of living conditions and in the comfort of a beautifully appointed home. . . . If you'd like to know more about Bellanca airplanes, we'll send you our illustrated literature; and you might mention this Bellanca ideal when the subject of a new plane is discussed.

"Eclipse,
present ... and
accounted for!"

The six Consolidated P2V-1 Navy Patrol Planes which undertook and completed the longest non-stop mass formation flight in history—2400 statute miles, from San Francisco to Pearl Harbor, Hawaii, in little over 24 hours. These planes, under command of Lt. Commander Kaefer McGinnis, are powered by two Wright Cyclone 575-horsepower engines each.

★ **T**★ HE brilliantly successful conclusion of the Navy's "routine transfer of equipment and personnel" in non-stop mass formation flight across 2400 miles of open water assuredly rates and receives the admiration of all men who fly. Eclipse Aviation Corporation's gratification is understandable, certainly, since the starters and generators of this company's manufacture participated, and we believe, assisted, in the success of this epoch-making flight.
